 SATO

We at UniBio uses plant factory to develop and manufacture functional proteins, particularly regenerative medicine product materials, safely and efficiently.

- Closed plant factory

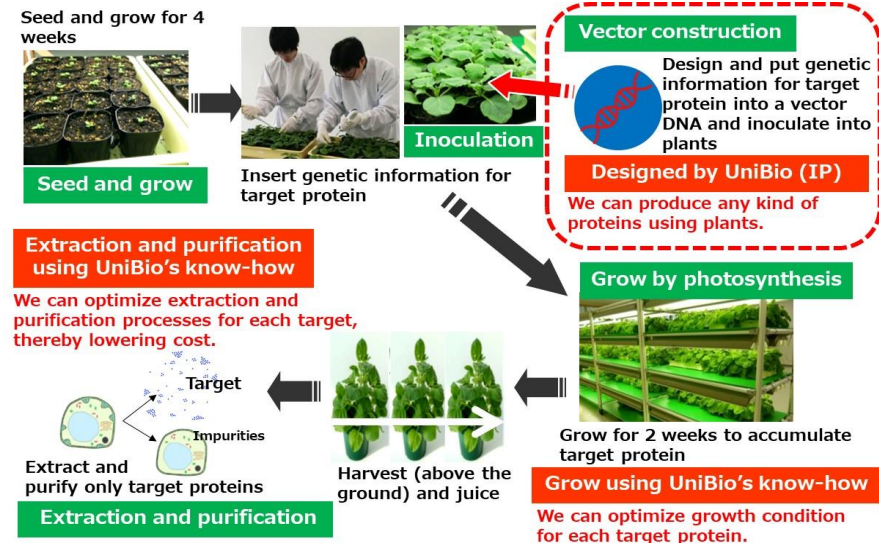

We can produce proteins safely and efficiently in our completely climate- controlled facility. Due to the scalability of the system, we can dramatically lower the manufacturing cost.

- Manufacture of cytokines using plants

Safety due to very low risk of viral infection compared to animal cells.

- Small-scale multi-product development and manufacture

We accumulated manufacturing technology and know-how that can be transferred to develop and manufacture many other target proteins.

Plant biotechnology in our hands!
